## Chapter 3 <br> Binomial Theorem

### 3.1 Introduction:

An algebraic expression containing two terms is called a binomial expression, Bi means two and nom means term. Thus the general type of a binomial is $a+b, x-2,3 x+4$ etc. The expression of a binomial raised to a small positive power can be solved by ordinary multiplication , but for large power the actual multiplication is laborious and for fractional power actual multiplication is not possible. By means of binomial theorem, this work reduced to a shorter form. This theorem was first established by Sir Isaac Newton.

### 3.2 Factorial of a Positive Integer:

If n is a positive integer, then the factorial of ' $n$ ' denoted by $n$ ! or
$n$ and is defined as the product of $\mathrm{n}+$ ve integers from n to 1 (or 1 to n )

$$
\text { i.e., } \quad n!=n(n-1)(n-2) \ldots \ldots 3.2 .1
$$

For example,

$$
\begin{array}{cc} 
& 4!=4 \cdot 3 \cdot 2 \cdot 1=24 \\
\text { and } & 6!=6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1=720
\end{array}
$$

one important relationship concerning factorials is that

$$
\begin{equation*}
(n+1)!=(n+1) n! \tag{1}
\end{equation*}
$$

$\qquad$
for instance,

$$
\begin{aligned}
5! & =5.4 .3 .2 .1 \\
& =5(4.3 .2 .1) \\
5! & =5.4!
\end{aligned}
$$

Obviously, $1!=1$ and this permits to define from equation (1)

$$
\mathrm{n}!=\frac{(\mathrm{n}+1)!}{\mathrm{n}+1}
$$

Substitute 0 for $n$, we obtain

$$
\begin{aligned}
& 0!=\frac{(0+1)!}{0+1}=\frac{1!}{1}=\frac{1}{1} \\
& 0!=1
\end{aligned}
$$

### 3.3 Combination:

Each of the groups or selections which can be made out of a given number of things by taking some or all of them at a time is called combination.

In combination the order in which things occur is not considered e.g.; combination of $a, b, c$ taken two at a time are $a b, b c, c a$.

The numbers $\binom{\mathrm{n}}{\mathrm{r}}$ or ${ }^{\mathrm{n}} \mathrm{c}_{\mathrm{r}}$
The numbers of the combination of $n$ different objects taken ' $r$ ' at a
time is denoted by $\binom{\mathrm{n}}{\mathrm{r}}$ or ${ }^{\mathrm{n}} \mathrm{c}_{\mathrm{r}}$ and is defined as,

$$
\binom{\mathrm{n}}{\mathrm{r}}=\frac{n!}{r!(n-r)!}
$$

e.g, $\quad\binom{6}{4}=\frac{6!}{4!(6-4)!}$

$$
=\frac{6 \times 5 \times 4!}{4!\times 2!}=\frac{6 \times 5}{2 \times 1}=15
$$

Example 1: Expand $\binom{7}{3}$
Solution. $\quad\binom{7}{3}=\frac{7!}{3!(7-3)!}$

$$
\begin{aligned}
& =\frac{7 \cdot 6 \cdot 5 \cdot 4!}{3.2 \cdot 1 \cdot 4!} \\
& =35
\end{aligned}
$$

This can also be expand as

$$
\binom{7}{3}=\frac{7.6 \cdot 5}{3.2 .1}=35
$$

If we want to expand $\binom{7}{5}$, then

$$
\binom{7}{5}=\frac{7 \cdot 6 \cdot 5 \cdot 4 \cdot 3}{5 \cdot 4 \cdot 3 \cdot 2 \cdot 1}=21
$$

Procedure: Expand the above number as the lower number and the lower number expand till 1.

## Method 2

For expansion of $\binom{n}{r}$ we can apply the method:
a. If $r$ is less than $(n-r)$ then take $r$ factors in the numerator from $n$ to downward and r factors in the denominator ending to 1 .
b. If $n-r$ is less than $r$, then take $(n-r)$ factors in the numerator from $n$ to downward and take $(n-r)$ factors in the denominator ending to 1 . For example, to expand $\binom{7}{5}$ again, here $7-5=2$ is less than 5, so take two factors in numerator and two in the denominator as, $\binom{7}{5}=\frac{7.6}{2.1}=21$

## Some Important Results

(i). $\binom{n}{0}=\frac{n!}{0!(n-0)!}=\frac{n!}{1 \times n!}=1$
(ii) $\quad\binom{n}{n}=\frac{n!}{n!(n-n)!}=\frac{n!}{n!\times 0!}=\frac{n!}{n!\times 1}=1$
(iii) $\binom{n}{r}=\binom{n}{n-r}$

For example

$$
\begin{aligned}
& \binom{4}{0}=\binom{4}{4}=1 \text { as } \quad \frac{4!}{0!(4-0)!}=\frac{4!}{4!0!} \\
& 1=1 \\
& \binom{4}{3}=\binom{4}{1}=4 \quad \text { as } \quad \frac{4!}{3!.1!}=\frac{4!}{1!.3!}
\end{aligned}
$$

$$
\frac{4.3!}{3!.1!}=\frac{4.3!}{1!.3!}
$$

$$
4=4
$$

Note: The numbers $\binom{n}{r}$ or ${ }^{n} \mathrm{C}_{\mathrm{r}}$ are also called binomial co-efficients

### 3.4 The Binomial Theorem:

The rule or formula for expansion of $(a+b)^{n}$, where $n$ is any positive integral power, is called binomial theorem .

For any positive integral $n$

$$
\begin{align*}
(a+b)^{n}= & \binom{n}{0} a^{n}+\binom{n}{1} a^{n-1} b+\binom{n}{2} a^{n-2}+\binom{n}{3} a^{n-3} b^{3} \ldots \ldots \\
& \left.+\binom{n}{r} a^{n-r} b^{r} \ldots \ldots \ldots+\binom{n}{n} b^{n} \ldots-\cdots-\cdots-\cdots-\cdots-\cdots-1\right) \tag{1}
\end{align*}
$$

or briefly, $\quad(a+b)^{n}=\sum_{r=0}^{n}\binom{n}{r} a^{n-r} b^{r}$
Remarks:- The coefficients of the successive terms are

$$
\binom{n}{0},\binom{n}{1},\binom{n}{2},----,\binom{n}{r}----,\binom{n}{n}
$$

and are called Binomial coefficients.
Note : Sum of binomial coefficients is $2^{n}$

## Another form of the Binomial theorem:

$$
\begin{align*}
& (a+b)^{n}=a^{n}+\frac{n}{1!} a^{n-1} b+\frac{n(n-1)}{2!} a^{n-2} b^{2}+\frac{n(n-1)(n-2)}{3!} a^{n-3} b^{3}+\ldots \ldots+ \\
& \frac{n(n-1)(n-2)-----(n-r+1)}{r!} a^{n-r} b^{r}+\ldots \ldots \ldots+b^{n}--\cdots----------(2) \tag{2}
\end{align*}
$$

Note: Since,

$$
\binom{\mathrm{n}}{\mathrm{r}}=\frac{n!}{r!(n-r)!}
$$

So, $\quad\binom{n}{0}=\frac{n!}{0!(n-0)!}=\frac{n!}{1 \times n!}=1$

$$
\begin{aligned}
& \binom{n}{1}=\frac{n!}{1!(n-1)!}=\frac{n(n-1)!}{1!(n-1)!}=\frac{n}{1!} \\
& \binom{n}{2}=\frac{n!}{2!(n-2)!}=\frac{n(n-2)!}{2!(n-2)!}=\frac{n(n-1)}{2!} \\
& \binom{n}{3}=\frac{n!}{3!(n-3)!}=\frac{n(n-1)(n-2)(n-3)!}{3!(n-3)!}=\frac{n(n-1)(n-2)}{3!}
\end{aligned}
$$

$$
\binom{\mathrm{n}}{\mathrm{r}}=\frac{\mathrm{n}(\mathrm{n}-1)(\mathrm{n}-2)!\ldots \ldots .(\mathrm{n}-\mathrm{r}+1)(\mathrm{n}-\mathrm{r})!}{\mathrm{r}!(\mathrm{n}-\mathrm{r})!}
$$

$$
=\frac{n(n-1)(n-2) \ldots \ldots .(n-r+1)}{r!}
$$

$$
\binom{n}{n}=\frac{n!}{n!(n-n)!}=\frac{n!}{n!\times 0!}=\frac{n!}{n!\times 1}=1
$$

The following points can be observed in the expansion of $(a+b)^{n}$

1. There are $(\mathrm{n}+1)$ terms in the expansion.
2. The $1^{\text {st }}$ term is $a^{\mathrm{n}}$ and $(\mathrm{n}+1)$ th term or the last term is $\mathrm{b}^{\mathrm{n}}$
3. The exponent of ' $a$ ' decreases from $n$ to zero.
4. The exponent of ' $b$ ' increases from zero to $n$.
5. The sum of the exponents of $a$ and $b$ in any term is equal to index $n$.
6. The co-efficients of the term equidistant from the beginning and end of the expansion are equal as $\binom{n}{r}=\binom{n}{n-r}$

### 3.5 General Term:

The term $\binom{n}{r} a^{n-r} b^{r}$ in the expansion of binomial theorem is
called the General term or $(r+1)$ th term. It is denoted by $\mathrm{T}_{\mathrm{r}+1}$. Hence

$$
\mathrm{T}_{\mathrm{r}+1}=\binom{\mathrm{n}}{\mathrm{r}} \mathrm{a}^{\mathrm{n}-\mathrm{r}} \mathrm{~b}^{\mathrm{r}}
$$

Note: The General term is used to find out the specified term or the required co-efficient of the term in the binomial expansion

Example 2: Expand $(x+y)^{4}$ by binomial theorem:

## Solution:

$$
\begin{aligned}
(x+y)^{4} & =x^{4}+\binom{4}{1} x^{4-1} y+\binom{4}{2} x^{4-2} y^{2}+\binom{4}{3} x^{4-3} y^{3}+y^{4} \\
& =x^{4}+4 x^{3} y+\frac{4 \times 3}{2 \times 1} x^{2} y^{2}+\frac{4 \times 3 \times 2}{3 \times 2 \times 1} x y^{3}+y^{4} \\
& =x^{4}+4 x^{3} y+6 x^{2} y^{2}+4 x y^{3}+y^{4}
\end{aligned}
$$

Example 3: Expand by binomial theorem $\left(a-\frac{1}{a}\right)^{6}$

## Solution:

$$
\begin{aligned}
\left(a-\frac{1}{a}\right)^{6} & =a^{6}+\binom{6}{1} a^{6-1}\left(-\frac{1}{a}\right)^{1}+\binom{6}{2} a^{6-2}\left(-\frac{1}{a}\right)^{2}+\binom{6}{3} a^{6-3}\left(-\frac{1}{a}\right)^{3}+ \\
& \binom{6}{4} a^{6-4}\left(-\frac{1}{a}\right)^{4}+\binom{6}{5} a^{6-5}\left(-\frac{1}{a}\right)^{5}+\binom{6}{6} a^{6-6}\left(-\frac{1}{a}\right)^{6} \\
& =a^{6}+6 a^{5}\left(-\frac{1}{a}\right)+\frac{6 \times 5}{2 \times 1} a^{4}\left(-\frac{1}{a^{2}}\right)+\frac{6 \times 5 \times 4}{3 \times 2 \times 1} a^{3}\left(-\frac{1}{a^{3}}\right)+
\end{aligned}
$$

$$
\begin{aligned}
& \frac{6 \times 5 \times 4 \times 3}{4 \times 3 \times 2 \times 1} a^{2}\left(-\frac{1}{a^{4}}\right)+\frac{6 \times 5 \times 4 \times 3 \times 2}{5 \times 4 \times 3 \times 2 \times 1} a\left(-\frac{1}{a^{5}}\right)^{5}+\left(-\frac{1}{a^{6}}\right) \\
& =a^{6}-6 a^{4}+15 a^{2}-20+\frac{15}{a^{2}}-\frac{6}{a^{5}}+\frac{1}{a^{6}}
\end{aligned}
$$

Example 4: Expand $\left(\frac{x^{2}}{2}-\frac{2}{x}\right)^{4}$

Solution:

$$
\begin{aligned}
\left(\frac{x^{2}}{2}-\frac{2}{x}\right)^{4}= & \left(\frac{x^{2}}{2}\right)^{4}+\binom{4}{1}\left(\frac{x^{2}}{2}\right)^{4-1}\left(\frac{-2}{x}\right)^{1}+\binom{4}{2}\left(\frac{x^{2}}{2}\right)^{4-2}\left(\frac{-2}{x}\right)^{2} \\
& +\binom{4}{3}\left(\frac{x^{2}}{2}\right)^{4-3}\left(\frac{-2}{x}\right)^{3}+\binom{4}{4}\left(\frac{x^{2}}{2}\right)^{4-4}\left(\frac{-2}{x}\right)^{4} \\
= & \frac{x^{4}}{16}+4\left(\frac{x^{2}}{2}\right)^{3}\left(-\frac{2}{x}\right)+\frac{4 \cdot 3}{2 \cdot 1}\left(\frac{x^{2}}{2}\right)^{2}\left(\frac{4}{x^{2}}\right)+ \\
& \frac{4 \cdot 3 \cdot 2}{3 \cdot 2 \cdot 1}\left(\frac{x^{2}}{2}\right)\left(-\frac{8}{x^{3}}\right)+\frac{16}{x^{4}} \\
= & \frac{x^{8}}{16}-4 \cdot \frac{x^{8}}{8} \cdot \frac{2}{x}+6 \cdot \frac{x^{4}}{4} \cdot \frac{4}{x^{2}}-4 \frac{x^{2}}{2} \cdot \frac{8}{x^{3}}+\frac{16}{x^{4}} \\
= & \frac{x^{8}}{16}-x^{5}+6 x^{2}-\frac{16}{x}+\frac{16}{x^{4}}
\end{aligned}
$$

Example 5: Expand (1.04) ${ }^{5}$ by the binomial formula and find its value to two decimal places.

## Solution:

$$
\begin{aligned}
(1.04)^{5} & =(1+0.04)^{5} \\
(1+0.04)^{5}= & (1)^{5}+\binom{5}{1}(1)^{5-1}(0.04)+\binom{5}{2}(1)^{5-2}(0.04)^{2}+\binom{5}{3} \\
& (1)^{5-3}(0.04)^{3}+\binom{5}{4}(1)^{5-4}(0.04)^{4}+(0.04)^{5} \\
= & 1 .+0.2+0.016+0.00064+0.000128 \\
& +0.0000001024 \\
= & 1.22
\end{aligned}
$$

Example 6: Find the eighth term in the expansion of $\left(2 x^{2}-\frac{1}{x^{2}}\right)^{12}$

Solution: $\quad\left(2 \mathrm{x}^{2}-\frac{1}{\mathrm{x}^{2}}\right)^{12}$
The General term is, $\quad T_{r+1}=\binom{n}{r} a^{n-r} b^{r}$
Here $\quad \mathrm{T}_{8}=? \quad \mathrm{a}=2 \mathrm{x}^{2}, \quad \mathrm{~b}=-\frac{1}{\mathrm{x}^{2}}, \mathrm{n}=12, \mathrm{r}=7$,
Therefore, $\mathrm{T}_{7+1}=\binom{12}{7}\left(2 \mathrm{x}^{2}\right)^{12-7}\left(-\frac{1}{\mathrm{x}^{2}}\right)^{7}$

$$
\begin{aligned}
\mathrm{T}_{8} & =\frac{12 \cdot 11 \cdot 10 \cdot 9 \cdot 8 \cdot 7 \cdot 6}{7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 1}\left(2 \mathrm{x}^{2}\right)^{5} \frac{(-1)^{7}}{\mathrm{x}^{14}} \\
\mathrm{~T}_{8} & =793 \times 32 \mathrm{x}^{10} \frac{(-1)}{\mathrm{x}^{14}} \\
\mathrm{~T}_{8} & =-\frac{25344}{\mathrm{x}^{4}}
\end{aligned}
$$

Eighth term $=\mathrm{T}_{8}=-\frac{25344}{\mathrm{x}^{4}}$

### 3.6 Middle Term in the Expansion (a + b) ${ }^{\mathbf{n}}$

In the expansion of $(a+b)^{n}$, there are $(n+1)$ terms.

## Case I :

If $\mathbf{n}$ is even then $(n+1)$ will be odd, so $\left(\frac{n}{2}+1\right)$ th term will be the only one middle term in the expension.

For example, if $\mathrm{n}=8$ (even), number of terms will be 9 (odd), therefore, $\left(\frac{8}{2}+1\right)=5^{\text {th }}$ will be middle term.

## Case II:

If $\mathbf{n}$ is odd then $(\mathrm{n}+1)$ will be even, in this case there will not be a single middle term, but $\left(\frac{\mathrm{n}+1}{2}\right)$ th and $\left(\frac{\mathrm{n}+1}{2}+1\right)$ th term will be the two middle terms in the expension.

For example, for $\mathrm{n}=9$ (odd), number of terms is 10 i.e. $\left(\frac{9+1}{2}\right)$ th and $\left(\frac{9+1}{2}+1\right)$ th i.e. $5^{\text {th }}$ and $6^{\text {th }}$ terms are taken as middle terms and these middle terms are found by using the formula for the general term.

## Example 7: Find the middle term of $\left(1-\frac{x^{2}}{2}\right)^{14}$.

## Solution:

We have $\mathrm{n}=14$, then number of terms is 15 .
$\therefore\left(\frac{14}{2}+1\right)$ i.e. $8^{\text {th }}$ will be middle term.
$\mathrm{a}=1, \mathrm{~b}=-\frac{\mathrm{x}^{2}}{2}, \quad \mathrm{n}=14, \mathrm{r}=7, \mathrm{~T}_{8}=$ ?
$\mathrm{T}_{\mathrm{r}+1}=\binom{\mathrm{n}}{\mathrm{r}} \mathrm{a}^{\mathrm{n}-\mathrm{r}} \mathrm{b}^{\mathrm{r}}$
$\mathrm{T}_{7+1}=\binom{14}{7}(1)^{14-7}\left(-\frac{\mathrm{x}^{2}}{2}\right)^{7}=\frac{14!}{7!7!}(-1)^{7} \frac{\mathrm{x}^{14}}{2^{7}}$
$\mathrm{T}_{8} \quad=\frac{14 \cdot 13 \cdot 12 \cdot 11 \cdot 10 \cdot 9 \cdot 8 \cdot 7!}{7 \cdot 6 \cdot 5 \cdot 4 \cdot 3 \cdot 2 \cdot 17!} \frac{(-1)}{128} \cdot \mathrm{x}^{14}$
$\mathrm{T}_{8} \quad=-(2)(13)(11)(2)(3) \frac{1}{128} \cdot \mathrm{x}^{14}$
$\mathrm{T}_{8} \quad=-\frac{429}{16} \quad x^{14}$
Example 8 : Find the coefficient of $x^{19}$ in $\left(2 x^{3}-3 x\right)^{9}$.
Solution:
Here, $\mathrm{a}=2 \mathrm{x}^{3}, \quad \mathrm{~b}=-3 \mathrm{x}, \quad \mathrm{n}=9$
First we find r .
Since $\operatorname{Tr}+1=\binom{n}{r} a^{n-r} b^{r}$

$$
\begin{align*}
& =\binom{9}{r}\left(2 x^{3}\right)^{9-r}(-3 x)^{r} \\
& =\binom{9}{r} 2^{9-r}(-3)^{r} x^{27-3 r} \cdot x^{r} \\
& =\binom{9}{r} 2^{9-r}(-3)^{r} \cdot x^{27-2 r} \ldots \tag{1}
\end{align*}
$$

But we require $x^{19}$, so put

$$
\begin{aligned}
19 & =27-2 \mathrm{r} \\
2 \mathrm{r} & =8 \\
\mathrm{r} & =4
\end{aligned}
$$

Putting the value of $r$ in equation (1)

$$
\begin{aligned}
\mathrm{T}_{4+1} & =\binom{9}{\mathrm{r}} 2^{9-4}(-3)^{4} \mathrm{x}^{19} \\
& =\frac{9.8 \cdot 7 \cdot 6 \cdot 5}{4 \cdot 3 \cdot 2 \cdot 1} \cdot 2^{5} \cdot 3^{4} \mathrm{x}^{19} \\
& =630 \times 32 \times 81 \mathrm{x}^{19} \\
\mathrm{~T}_{5} \quad & =1632960 \times \mathrm{x}^{9}
\end{aligned}
$$

Hence the coefficient of $\mathrm{x}^{19}$ is 1632960
Example 9: Find the term independent of $x$ in the expansion of $\left(2 \mathrm{x}^{2}+\frac{1}{\mathrm{x}}\right)^{9}$.

## Solution:

Let $\mathrm{T}_{\mathrm{r}+1}$ be the term independent of x .
We have $\mathrm{a}=2 \mathrm{x}^{2}, \mathrm{~b}=\frac{1}{\mathrm{x}}, \mathrm{n}=9$

$$
\begin{align*}
& \mathrm{T}_{\mathrm{r}+1}=\binom{\mathrm{n}}{\mathrm{r}} \mathrm{a}^{\mathrm{n}-\mathrm{r}} \mathrm{~b}^{\mathrm{r}}=\binom{9}{\mathrm{r}}\left(2 \mathrm{x}^{2}\right)^{9-\mathrm{r}}\left(\frac{1}{\mathrm{x}}\right)^{\mathrm{r}} \\
& \mathrm{~T}_{\mathrm{r}+1}=\binom{9}{\mathrm{r}} 2^{9-\mathrm{r}} \cdot \mathrm{x}^{18-2 \mathrm{r}} \cdot \mathrm{x}^{\mathrm{r}} \\
& \mathrm{~T}_{\mathrm{r}+1}=\binom{9}{\mathrm{r}} 2^{9-\mathrm{r}} \cdot \mathrm{x}^{18-3 \mathrm{r}} \ldots \ldots \ldots \ldots \ldots(1) \tag{1}
\end{align*}
$$

Since $T_{r+1}$ is the term independent of $x$ i.e. $x^{0}$.
$\therefore$ power of x must be zero.
i.e. $18-3 r=0 \Rightarrow r=6$
put in (1)

$$
\begin{aligned}
\mathrm{T}_{\mathrm{r}+1} & =\binom{9}{6} 2^{9-6} \cdot x^{0}=\frac{!9}{!6!3^{2^{3}}} \cdot 1 \\
& =\frac{39 \cdot 8^{4} \cdot 7 \cdot 6!}{6!\cdot 3 \cdot 2 \cdot 1} \cdot 8 \cdot 1=672
\end{aligned}
$$

### 3.7 Binomial Series

Since by the Binomial formula for positive integer $n$, we have
$(a+b)^{n}=a^{n}+\frac{n}{1!} a^{n-1} b+\frac{n(n-1)}{2!} a^{n-2} b^{2}+\frac{n(n-1)(n-2)}{3!} a^{n-3} b^{3}+$ $\ldots \ldots \ldots \ldots \ldots+b^{n}$
put $\mathrm{a}=1$ and $\mathrm{b}=\mathrm{x}$, then the above form becomes:
$(1+x)^{n}=1+\frac{n}{1!} x+\frac{n(n-1)}{2!} x^{2}+\ldots \ldots . .+x^{n}$
if n is -ve integer or a fractional number (-ve or +ve ), then

$$
\begin{equation*}
(1+x)^{n}=1+\frac{n}{1!} x+\frac{n(n-1)}{2!} x^{2}+. \tag{3}
\end{equation*}
$$

The series on the R.H.S of equation (3) is called binomial series.
This series is valid only when x is numerically less than unity
i.e., $|\mathrm{x}|<1$ otherwise the expression will not be valid.

Note: The first term in the expression must be unity. For example, when $n$ is not a positive integer (negative or fraction) to expand $(a+x)^{n}$, we shall have to write it as, $(a+x)^{n}=a^{n}\left(1+\frac{x}{a}\right)^{n}$ and then apply the binomial series, where $\left|\frac{\mathrm{x}}{\mathrm{a}}\right|$ must be less than 1.

### 3.8 Application of the Binomial Series; Approximations:

The binomial series can be used to find expression approximately equal to the given expressions under given conditions.
Example 1: If $x$ is very small, so that its square and higher powers can be neglected then prove that

$$
\frac{1+x}{1-x}=1+2 x

& \quad=\frac{1}{8}\left[1-\frac{3}{2} x+3 x^{2}+---\right] \\

& =5\left[1-\frac{1}{2.5^{2}}-\frac{1}{2^{3} \cdot 5^{4}}-\frac{1}{2^{4} .5^{6}}-----\right] \\

& =3\left[1+\frac{1}{3}\left(\frac{2}{27}\right)+\frac{\frac{1}{3}\left(\frac{1}{3}-1\right)}{1.2}\left(\frac{2}{27}\right)^{2}+\ldots \ldots \ldots .\right] \\
& =3\left[1+\frac{2}{81}+\frac{1}{2}\left(\frac{1}{3}\right)\left(-\frac{2}{3}\right)\left(\frac{2}{27}\right)^{2}+\ldots \ldots \ldots .\right] \\

## Summary

## Binomial Theorem

An expression consisting of two terms only is called a binomial expression. If n is a positive index, then

1. The general term in the binomial expansion is $\mathrm{T}_{\mathrm{r}-1}={ }^{\mathrm{n}} \mathrm{C}_{\mathrm{r}} \mathrm{a}^{\mathrm{n-r}} \mathrm{~b}^{\mathrm{r}}$
2. The number of terms in the expansion of $(a+b)^{n}$ is $n+1$.
3. The sum of the binomial coefficients in the expansion of $(a+b)^{n}$ is $2^{n}$.i.e. ${ }^{n} C_{0}+{ }^{n} C_{1}+{ }^{n} C_{2}+\ldots . .+{ }^{n} C_{n}=2^{n}$
4. The sum of the even terms in the expansion of $(a+b)^{n}$ is equal to the sum of odd terms.
5. When n is even, then the only middle term is the $\left(\frac{\mathrm{n}+2}{2}\right)$ th term.
6. When n is odd, then there are two middle terms viz $\left(\frac{\mathrm{n}+1}{2}\right)$ th and $\left(\frac{\mathrm{n}+3}{2}\right)$ th terms.
Note: If n is not a positive index.
i.e. $(a+b)^{n}=a^{n}\left(1+\frac{n}{a}\right)^{n}$

$$
=\mathrm{a}^{\mathrm{n}}\left[1+\mathrm{n}\left(\frac{\mathrm{~b}}{\mathrm{a}}\right)+\frac{\mathrm{n}(\mathrm{n}-1)}{2!}\left(\frac{\mathrm{b}}{\mathrm{a}}\right)^{2}+-------\right]
$$

1. Here n is a negative or a fraction, the quantities ${ }^{\mathrm{n}} \mathrm{C}_{1},{ }^{\mathrm{n}} \mathrm{C}_{2}$------here no meaning at all. Hence co-efficients can not be represented as ${ }^{\mathrm{n}} \mathrm{C}_{1},{ }^{\mathrm{n}} \mathrm{C}_{2}$---------.
2. The number of terms in the expansion is infinite as n is a negative or fraction.
